Page 88	Map of cancer networks and estimated populations
Page 89	NCIN Core Objectives

<sup>^</sup> All other malignant neoplasms comprises of the following ICD-10 codes: C17, C21, C23-C24, C26, C37-C41, C46-C49, C51-C52, C57-C58, C60, C63, C69, C73-C80, C97.

All cancer sites have been coded to the International Classification of Disease, tenth revision (ICD-10).

## Foreword

Today there are just over two million people in the UK living with or beyond cancer and this is rising by more than 3% a year as a result of increasing incidence and survival.

The vision for the National Cancer Survivorship Initiative for England is for cancer “survivors” to be supported to live as healthy and active life as possible for as long as possible. The vision, while developed for one of the UK’s four Nations, articulates five major shifts required to support anyone living with cancer, along their whole journey.

Achieving these shifts will require health and social care services which are responsive to individual needs. To plan and organise them we need to understand more about the two million cancer survivors and where they are.

This report builds on the report for England published in 2009 by providing a breakdown of survivors for the whole of the UK and for many more different types of cancer. This will allow a significant step forward to be made in assessing demand, equity and access of services for each cancer type across the UK.

It also provides a basis for continuing work at the Thames Cancer Registry to quantify the needs of survivors over time.

**Ciarán Devane**

## Acknowledgements

These analyses were undertaken by Thames Cancer Registry on behalf of the National Cancer Intelligence Network (NCIN) and Macmillan Cancer Support.

## Introduction

This report presents one-year, five-year and ten-year prevalence of cancer in the United Kingdom, as well as in English and Scottish cancer networks, with national estimates for Wales and Northern Ireland, for the end of 2006. These analyses follow on from those published in the 2009 NCIN report “*One Year and Five Year Cancer Prevalence By Cancer Network, England, 2004*”.

Cancer prevalence is the number of people, or the proportion of the population, who are alive on a specified index date (in this report the 31<sup>st</sup> December 2006) and have previously been diagnosed with cancer. As such it is an indicator of the burden of cancer and can help to inform health care service planning. This report provides one-year, five-year and ten-year prevalence (those people who were up to one year, five years and ten years from diagnosis and still alive on the 31<sup>st</sup> December 2006). National estimates of twenty-year prevalence of cancer in England and Scotland for the end of 2006 are presented in Annex 1. It was not possible to produce equivalent national estimates for Wales and Northern Ireland.

The cancer prevalence figures supplement the generally available vital statistics about cancer occurrence (cancer incidence) and deaths from cancer (cancer mortality). The resource needs for diagnostic and initial treatment will be proportional to, and well quantified by, cancer incidence as routinely reported by cancer registries. Similarly, the needs for palliative and terminal care are adequately quantified by cancer mortality statistics as reported by the Official of National Statistics on the basis of death certification.

The cancer prevalence measure falls somewhere between incidence and mortality, and measures the burden of cancer in terms of the number of people who have or have had cancer. The cancer survivorship agenda is not merely about counting the cases or the deaths, but about compassion and care for those directly or indirectly affected by cancer. Cancer prevalence quantifies the magnitude of this challenge.

The data analysed in this report were for all malignant neoplasms diagnosed between 1997 and 2006, and registered by the eight cancer registries in England and the registries of Scotland, Wales and Northern Ireland. To ensure that patients, rather than tumours, were counted, only the first diagnosed tumour (excluding non-melanoma skin cancer) in each patient was included in the analysis. Prevalence figures have been presented as simple counts of patients as well as crude and European age-standardised proportions (per 100,000 population).

Information is provided for all malignant neoplasms excluding non-melanoma skin cancer (C00-C97 xC44), for 22 common cancers grouped according to the ICD-10 classification, and also for all other malignant neoplasms. All other malignant neoplasms covers all malignant neoplasms excluding the 22 common cancers analysed in this report and non-melanoma skin cancer (information on the ICD-10 codes included are documented in the methodology section of this report).

Patients resident in England were assigned a cancer network of residence by matching their postcode at diagnosis to the National Cancer Postcode Directory. Patients resident in Scotland were assigned a cancer network of residence from their NHS Board of residence. Over 99.9% of prevalent patients were successfully assigned a cancer network of residence.

Prevalence figures are influenced by both incidence and survival. One-year prevalence is highly correlated with incidence whereas five-year and ten-year prevalence are correlated with both incidence and survival. Thus, the most prevalent types of cancer are those with a relatively high incidence rate and a good prognosis. In the United Kingdom the most prevalent cancer in males is prostate cancer and in females it is breast cancer.

At the end of 2006, there were over 200,000 prevalent cancer patients in the UK who were less than one year from their diagnosis; 166,000 in England, 18,000 in Scotland, 11,000 in Wales and 5,000 in Northern Ireland. For England, this represents a 5% increase in prevalence when compared with the figures published in the previous version of this report for 2004. An increase of 6% was also seen for five-year prevalence from 2004 to 2006. In total, there were 1.13 million cancer survivors in the United Kingdom who were up to 10 years from diagnosis at the end of 2006; equivalent to a crude proportion of 1,866 per 100,000 population or an age-standardised proportion of 1,501 per 100,000 population.

A report last year produced by organisations within the NCIN<sup>1</sup> showed that men had higher incidence and mortality rates than females. This can also be seen in cancer prevalence in the UK. Fifteen of the sixteen cancers that affect both sexes showed higher one-year, five-year and ten-year prevalence rates for males compared to females (excluding breast cancer and all other malignant neoplasms).

Variation in prevalence is also evident between networks and countries. Combined male and female prevalence of all malignant neoplasms (exc. NMSC) was highest in Wales for one-year, five-year and ten-year age-standardised prevalence rates. Dorset Cancer Network had the highest prevalence rates of any individual cancer network; whereas the lowest prevalence rates were in West London Cancer Network for one-year, North East London for five-year and Sussex for ten-year.

This report gives a detailed account of cancer prevalence in the United Kingdom, and regional variations. It is hoped that these figures will be of use to those responsible for planning local treatment and support services for patients living with a diagnosis of cancer.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

United Kingdom	3,497	11.8	11.5	11.2 - 11.9	2,693	8.7	8.6	8.3 - 8.9	6,190	10.2	10.1	9.8 - 10.3

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

<sup>^</sup>All other malignant neoplasms includes the following ICD-10 codes: C17, C21, C23-C24, C26, C37-C41, C46-C49, C51-C52, C57-C58, C60, C63, C69, C73-C80, C97.

<sup>\*</sup>Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

<sup>^</sup>All other malignant neoplasms includes the following ICD-10 codes: C17, C21, C23-C24, C26, C37-C41, C46-C49, C51-C52, C57-C58, C60, C63, C69, C73-C80, C97.

\*Age-standardised proportion to the European Standard Population. Crude and age-standardised proportions are shown per 100,000 population.

<sup>1</sup> Cancer survivors were assigned a cancer network based on their postcode of residence at time of diagnosis. It was not possible to map all patients to a cancer network due to incomplete or missing postcodes, therefore the sum of the patients from the English and Scottish cancer networks may be less than the total number of patients for the respective countries.

## **Annex 1**

This annex presents national estimates of twenty-year prevalence of cancer in England and Scotland, for the end of 2006. It was not possible to produce equivalent national estimates for Wales and Northern Ireland. These estimates were produced in addition to the UK analyses covering one-year, five-year and ten-year prevalence of cancer.

<sup>^</sup>All other malignant neoplasms includes the following ICD-10 codes: C17, C21, C23-C24, C26, C37-C41, C46-C49, C51-C52, C57-C58, C60, C63, C69, C73-C80, C97.

## Methodology

ISD Scotland, the Welsh Cancer Intelligence and Surveillance Unit, the Northern Ireland Cancer Registry and the eight cancer registries in England provided data containing demographic, tumour and follow-up details for all registered malignant neoplasms (ICD-10 C00-C97 excluding non-melanoma skin cancer, C44) diagnosed between 1997 and 2006.

Patients may be diagnosed with more than one tumour in their lifetime. In order to count prevalence of patients, only the first diagnosed tumour in each patient was included in the analysis. Prevalence was calculated by counting all those patients in the data who were still alive on the index date, 31<sup>st</sup> December 2006.

Residents of England were assigned a cancer network by matching their postcode at the time of diagnosis to the National Cancer Postcode Directory.

In Scotland, residents were assigned a cancer network from their NHS Board of residence. The NHS Board of residence was assigned by matching the postcode at the time of diagnosis to the General Register Office for Scotland (GROS) postcode file.

<b>Cancer Network</b>	<b>NHS Board of residence</b>
North of Scotland	Grampian; Highland and Argyll; Orkney; Shetland; Tayside; Western Isles.
South East Scotland	Borders; Dumfries and Galloway; Fife; Lothian.
West of Scotland	Ayrshire and Arran; Forth Valley; Greater Glasgow and Clyde; Lanarkshire.

A small number of patients had missing or incomplete postcodes, however 99.95% of patients in the dataset were successfully assigned a cancer network of residence. For this report, Wales provided data for its entirety and not for the three cancer networks of Wales. Northern Ireland is in its entirety, one cancer network.

All other malignant neoplasms group included the following ICD-10 codes: C17, C21, C23-C24, C26, C30-C32, C37-C42, C46-C49, C51-C52, C57-C58, C60, C63, C69, C73-C80, C97.

## Glossary

### One-Year, Five-Year and Ten-Year Cancer Prevalence

The total number of patients who had been diagnosed with cancer up to one year, up to five years, or up to ten years before 31<sup>st</sup> December 2006, and who were still alive on 31<sup>st</sup> December 2006.

### Crude Proportion

The crude proportion was calculated by dividing the number of patients by the population at risk in 2006. The proportion is given per 100,000 population. The crude proportion does not take into account the age structure of the different populations and therefore does not adjust for the confounding effect this may have.

### Age-Standardised Proportion (ASP)

The ASP is used to eliminate the variation in the age structures of populations to allow comparisons between different areas to be made. The ASP is obtained by using a weighted average of age-specific proportions, i.e. the crude proportions within each five-year age group. Direct age-standardisation has been used, applied to the European Standard Population. ASPs are the figures which should be used when making comparisons between the different networks or countries, if one wishes to account for differences in age distribution.

### 95% Confidence Interval (95% C.I.)

For the ASP, a 95% confidence interval is given. Confidence intervals are used as a measure of uncertainty in the estimated proportions. The upper and lower limits of the interval show how big a contribution chance may have made to a particular statistic. The 95% confidence intervals quoted give the range in which the proportion in question would fall 19 times out of 20, were it possible to repeat the analysis.

### Cancer Networks

At the time these analyses were undertaken, there were 28 Cancer Networks in England, three in Scotland and one that covers the entirety of Northern Ireland. Although Wales consists of three cancer networks, prevalence has only been calculated for the whole of Wales for this report.

Cancer Networks bring together health service commissioners, providers, the voluntary sector and local authorities to coordinate services for patients across all aspects of care within a geographical area.

A map of Cancer Network boundaries is available on the following page with the estimated populations for 2006.

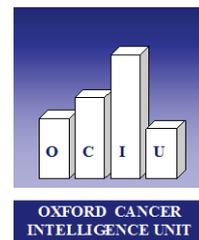

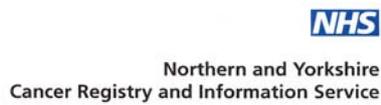

# Cancer Networks and estimated 2006 populations
